Deployment Pipeline - Release Flow

- Use alpha track as just a release management
- Try the production build via DeployGate
 - Didn't pin the link anywhere but it was visible on Travis:)
- Why Travis?
 - Because of secure tokens matter \(\begin{aligned} \equiv \left\)
 - A playground to build iOS app as well

Be Flexible, Configurable, Semi-Interactive

- Be flexible with failures
 - *We* should handle CI failures instead of commands
- Be configurable by injection
 - Manipulate dependencies & platform-specific values.
- Be semi-interactive
 - Collect stats and reports, also rely on the bot.
